

Анализ файловой структуры UNIX. Команды для работы с файлами и каталогами

Аристил Линдсэй Виллиам¹

7 марта, 2023, Москва, Россия

¹Российский Университет Дружбы Народов

Цели и задачи работы

Цель лабораторной работы

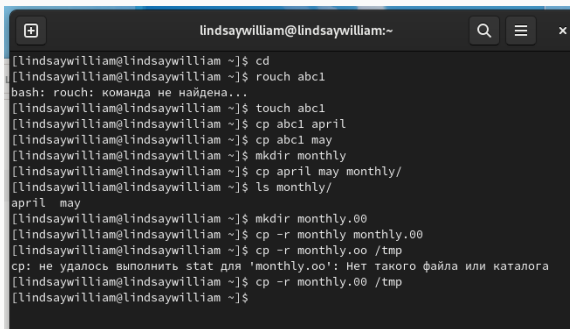

Ознакомление с файловой системой Linux, её структурой, именами и содержанием каталогов. Приобретение практических навыков по применению команд для работы с файлами и каталогами, по управлению процессами, по проверке использования диска и обслуживанию файловой системы.

Задачи лабораторной работы

- 1 Выполнить примеры
- 2 Выполнить действия по работе с каталогами и файлами
- 3 Выполнить действия с правами доступа
- 4 Получить дополнительные сведения при помощи справки по командам.

Процесс выполнения лабораторной работы

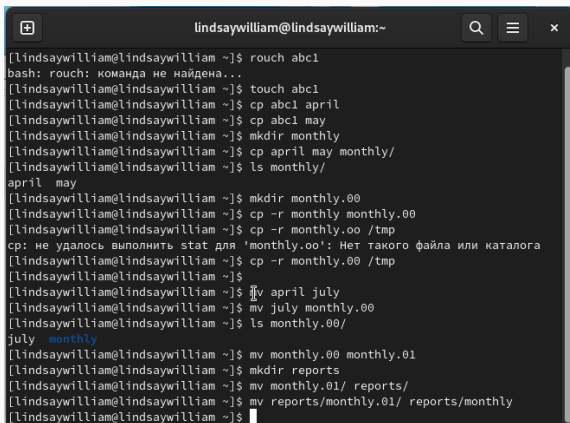

Выполнение примеров

```
lindsaywilliam@lindsaywilliam:~  
[lindsaywilliam@lindsaywilliam ~]$ cd  
[lindsaywilliam@lindsaywilliam ~]$ rouch abc1  
bash: rouch: команда не найдена...  
[lindsaywilliam@lindsaywilliam ~]$ touch abc1  
[lindsaywilliam@lindsaywilliam ~]$ cp abc1 april  
[lindsaywilliam@lindsaywilliam ~]$ cp abc1 may  
[lindsaywilliam@lindsaywilliam ~]$ mkdir monthly  
[lindsaywilliam@lindsaywilliam ~]$ cp april may monthly/  
[lindsaywilliam@lindsaywilliam ~]$ ls monthly/  
april  may  
[lindsaywilliam@lindsaywilliam ~]$ mkdir monthly.00  
[lindsaywilliam@lindsaywilliam ~]$ cp -r monthly monthly.00  
[lindsaywilliam@lindsaywilliam ~]$ cp -r monthly.00 /tmp  
cp: не удалось выполнить stat для 'monthly.00': Нет такого файла или каталога  
[lindsaywilliam@lindsaywilliam ~]$ cp -r monthly.00 /tmp  
[lindsaywilliam@lindsaywilliam ~]$
```

Рис. 5: Настройка прав доступа

Файл /etc/passwd

A terminal window titled 'lindsaywilliam@lindsaywilliam:~ — less /etc/passwd' displays the contents of the /etc/passwd file. The window has a dark background with light-colored text. The file content is a list of system and user accounts, each on a new line, separated by colons. The accounts listed are: root, bin, daemon, adm, lp, sync, shutdown, halt, mail, operator, games, ftp, nobody, dbus, apache, tss, systemd-network, systemd-oom, systemd-resolve, qemu, polkitd, avahi, unbound, nm-openconnect, geoclue, usbmuxd, and gluster. The terminal window includes standard UI elements like a search icon, a menu icon, and a close button in the top right corner.

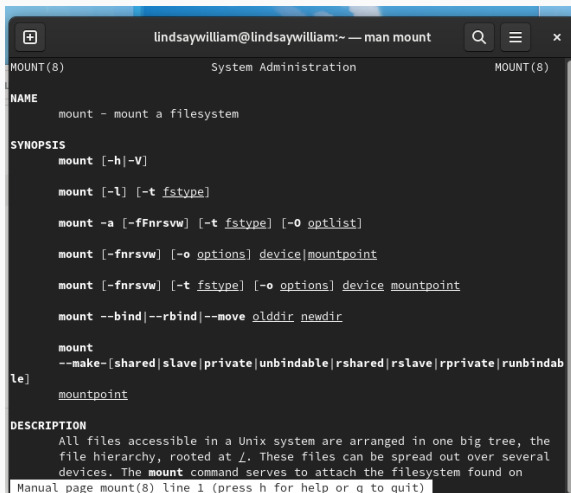

```
lindsaywilliam@lindsaywilliam:~ — less /etc/passwd
root:x:0:0:root:/root:/bin/bash
bin:x:1:1:bin:/bin:/sbin/nologin

bash: cd: play/: Отказано в доступе  
[lindsaywilliam@lindsaywilliam ~]$ chmod +x play/  
[lindsaywilliam@lindsaywilliam ~]$
```

Рис. 7: Работа с файлами и правами доступа

A terminal window titled "lindsaywilliam@lindsaywilliam:~ — man mount" displays the manual page for the `mount` command. The window has a dark background with light-colored text. The terminal output is as follows:

```
MOUNT(8)                                System Administration                                MOUNT(8)

NAME
    mount - mount a filesystem

SYNOPSIS
    mount [-h|-V]

    mount [-l] [-t fstype]

    mount -a [-ffnrsvw] [-t fstype] [-O optlist]

    mount [-fnrsvw] [-o options] device|mountpoint

    mount [-fnrsvw] [-t fstype] [-o options] device mountpoint

    mount --bind|--rbind|--move olddir newdir

    mount
    --make=[shared|slave|private|unbindable|rshared|rslave|rprivate|runbindab
le]
    mountpoint

DESCRIPTION
    All files accessible in a Unix system are arranged in one big tree, the
    file hierarchy, rooted at /. These files can be spread out over several
    devices. The mount command serves to attach the filesystem found on

Manual page mount(8) line 1 (press h for help or q to quit)
```

```
lindsaywilliam@lindsaywilliam:~ — man fsck
FCK(8)                                System Administration          FCK(8)

NAME
    fsck - check and repair a Linux filesystem

SYNOPSIS
    fsck [-lsAVRTMNP] [-r [fd]] [-C [fd]] [-t fstype] [filesystem...] [--]
    [fs-specific-options]

DESCRIPTION
    fsck is used to check and optionally repair one or more Linux
    filesystems. filesystem can be a device name (e.g., /dev/hdc1,
    /dev/sdb2), a mount point (e.g., /, /usr, /home), or an filesystem
    label or UUID specifier (e.g.,
    UUID=8868abf6-88c5-4a83-98b8-bfc24057f7bd or LABEL=root). Normally, the
    fsck program will try to handle filesystems on different physical disk
    drives in parallel to reduce the total amount of time needed to check
    all of them.

    If no filesystems are specified on the command line, and the -A option
    is not specified, fsck will default to checking filesystems in
    /etc/fstab serially. This is equivalent to the -As options.

    The exit status returned by fsck is the sum of the following
    conditions:

    0

Manual page fsck(8) line 1 (press h for help or q to quit)

Справка по командам

```
lindsaywilliam@lindsaywilliam:~ — man mkfs
MKFS(8)                               System Administration                               MKFS(8)

NAME
    mkfs - build a Linux filesystem

SYNOPSIS
    mkfs [options] [-t type] [fs-options] device [size]

DESCRIPTION
    This mkfs frontend is deprecated in favour of filesystem specific
    mkfs.<type> utils.

    mkfs is used to build a Linux filesystem on a device, usually a hard
    disk partition. The device argument is either the device name (e.g.,
    /dev/hda1, /dev/sdb2), or a regular file that shall contain the
    filesystem. The size argument is the number of blocks to be used for
    the filesystem.

    The exit status returned by mkfs is 0 on success and 1 on failure.

    In actuality, mkfs is simply a front-end for the various filesystem
    builders (mkfs.fstype) available under Linux. The filesystem-specific
    builder is searched for via your PATH environment setting only. Please
    see the filesystem-specific builder manual pages for further details.

OPTIONS
    -t, --type type
    Manual page mkfs(8) line 1 (press h for help or q to quit)
```

Рис. 10: Команда mkfs

```
lindsaywilliam@lindsaywilliam:~ — man kill
KILL(1) User Commands KILL(1)

NAME
    kill - terminate a process

SYNOPSIS
    kill [-signal|-s signal|-p] [-q value] [-a] [--timeout milliseconds
    signal] [--] pid|name...

    kill -l [number] | -L

DESCRIPTION
    The command kill sends the specified signal to the specified processes
    or process groups.

    If no signal is specified, the TERM signal is sent. The default action
    for this signal is to terminate the process. This signal should be used
    in preference to the KILL signal (number 9), since a process may
    install a handler for the TERM signal in order to perform clean-up
    steps before terminating in an orderly fashion. If a process does not
    terminate after a TERM signal has been sent, then the KILL signal may
    be used; be aware that the latter signal cannot be caught, and so does
    not give the target process the opportunity to perform any clean-up
    before terminating.

    Most modern shells have a builtin kill command, with a usage rather
    similar to that of the command described here. The --all, --pid, and
    Manual page kill(1) line 1 (press h for help or q to quit)
```

Выводы по проделанной работе

В ходе данной работы мы ознакомились с файловой системой Linux, её структурой, именами и содержанием каталогов. Научились совершать базовые операции с файлами, управлять правами их доступа для пользователя и групп. Ознакомились с Анализом файловой системы. А также получили базовые навыки по проверке использования диска и обслуживанию файловой системы.
